

Corrigendum for WIDER Working Paper No. 2013/021 “Making aid work for education in developing countries: An analysis of aid effectiveness for primary education coverage and quality” by Kassandra Birchler, and Katharina Michaelowa

On page 4 of the working paper and in the variable description (Table A1, p. 26) we state that the main explanatory variable EDUCAID includes all aid disbursements for education, as reported to the OECD’s creditor reporting system (CRS), in constant 2010 US\$, and is expressed in per capita of the recipient country population. De facto, the econometric findings reported in the paper reflect absolute aid disbursement for education – and not per capita. Since our main specification (Table 1, Regression 4) uses the log of EDUCAID, this does not change much of the results, even in terms of the coefficient estimates. Our earlier sentence *“As a rough approximation, the coefficient indicates that doubling annual education aid per capita for a period five consecutive years implies a 5.6% increase in net enrolment rates.”* (p. 8), only needs to be adjusted upward to 6% rather than 5.6%: A doubling of annual education aid per capita leads to an increase in net enrolment by 6 percentage points. Hence the main argument of the paper, i.e. that donors’ increase in funding has substantially contributed to the successful increase in enrolment over the last 15 years, is still supported by the empirical evidence. In reasonable specifications, it holds not only for absolute aid, but also for aid per capita.

The re-calculation of all estimations using education aid per capita as initially intended reveals only two changes:

- (1) In those regressions that we already considered less convincing methodologically in the initial paper (notably the GMM estimates in the appendix, and Regressions 1-2 in Table 1), education aid per capita is generally insignificant. The methodological concerns with these regressions were discussed on p. 6ff. in the original paper.
- (2) When looking at aid per capita to specific areas within education (Table 2), we find one more significant interaction term supporting our initial hypothesis of a complementarity between infrastructure and teacher training (see p. 14). Both variables are now individually significant and positive (at the median of the other variable), and the interaction effect is positively significant, too (Table 2, Regression 14, and Figure 3)

For further reference, all regression tables and related graphs using the corrected education aid per capita variable are presented below.
