A combination of sources is used by Bourguignon and
Morrisson (1989) to form mean incomes for population groups
based on sector and labour status. 240 such groups were identified
in 1980. For the other years a secondary source, Bellon (1982) is
cited. He uses a similar method but with less detailed background
data. The income concept appears to be earnings.

Household Consumption and Expenditure Survey 1985

This survey is used by WB Morocco (1994) and World Bank
Poverty Monitoring Database. The survey included 7839 urban and
6366 rural households and was conducted separately in urban and
rural areas from November 1984 to November 1985. The
household completed and aide-mémoire recording daily purchase
for seven days.

This survey is used by WB Morocco (1994), World Bank Poverty

There was no documentation available for the 1995 survey so the
following applies to 1991: The survey included 1650 urban and
1673 rural households and was conducted from October 1990 to
November 1991. It is reported to estimate total consumption more accurately than the 1985 survey described above. The first interview lasted for seven days, while a second occurred one week later for another full seven days. Effort was made to exhaustively collect the consumption data. For example, wood collected by the household for cooking and heating was carefully valued and added to the consumption data. In rural areas this could make a sizeable difference to total consumption. Also individual expenditures were more carefully surveyed in 1990/91.
